

El plan del día

Repaso

Dando vida a programas gráficos

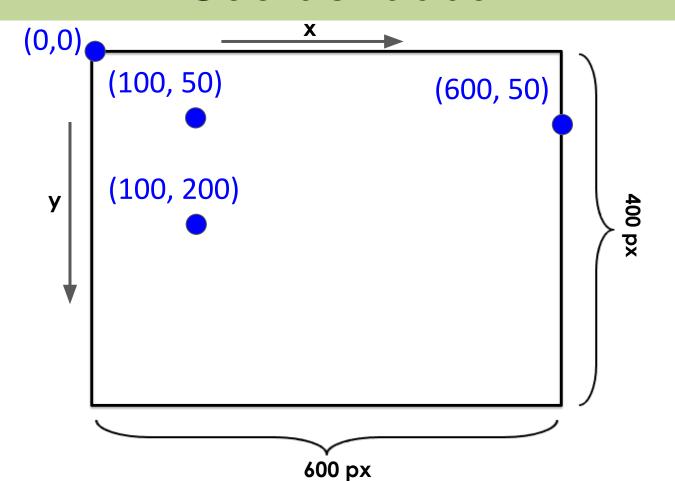

El bucle de animación

Cubo que rebota

Repaso

Como dibujamos por la computadora?

Coordenadas

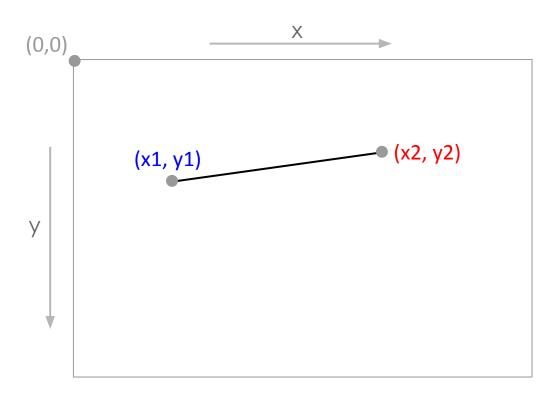

Canvas en Python

```
from graphics import Canvas
     def main():
                                                               Hola, graficos
         # ancho=600, altura=400
         canvas = Canvas(600, 400)
         canvas.set title("Hola, graficos")
         # ignora esto
10.
         canvas.mainloop()
11.
```

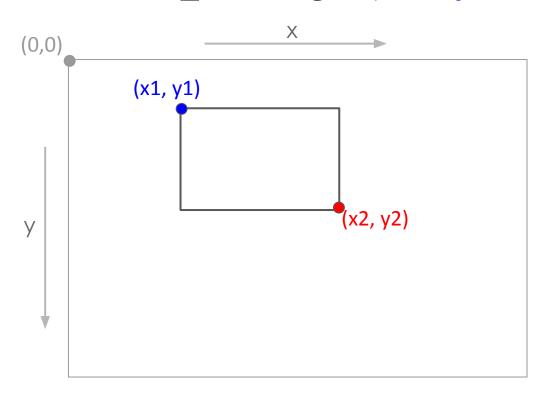

Línea

canvas.create_line(x1, y1, x2, y2)

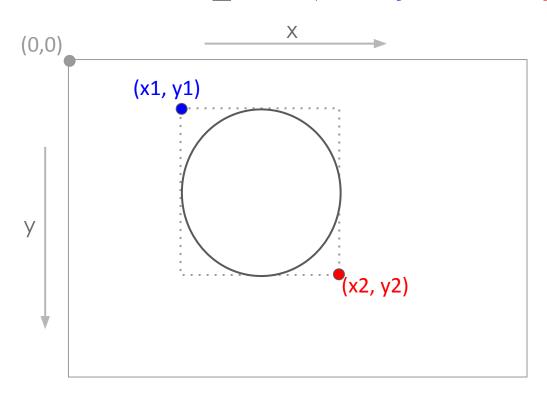

Rectángulo

canvas.create_rectangle(x1, y1, x2, y2)

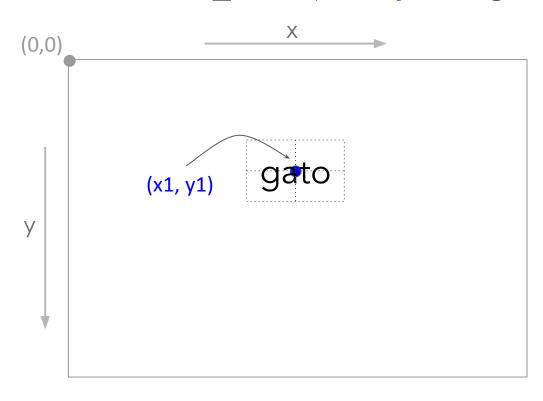

Óvalo

canvas.create_oval(x1, y1, x2, y2)

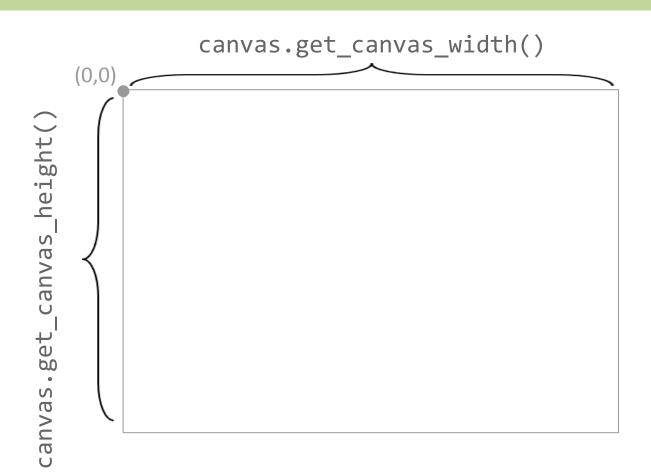

Texto

canvas.create_text(x1, y1, "gato")

El posición de las formas

Animación

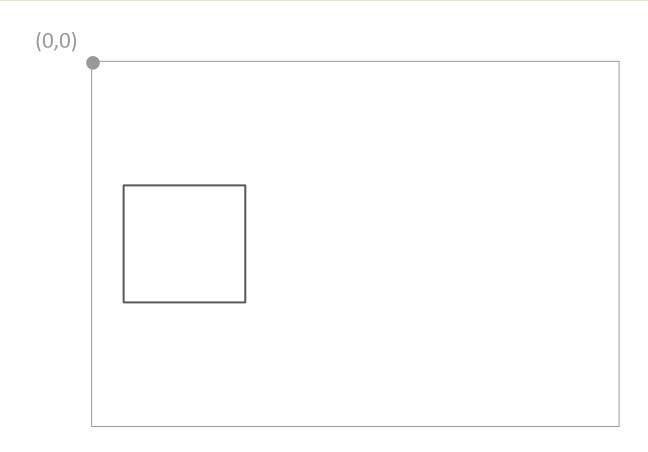

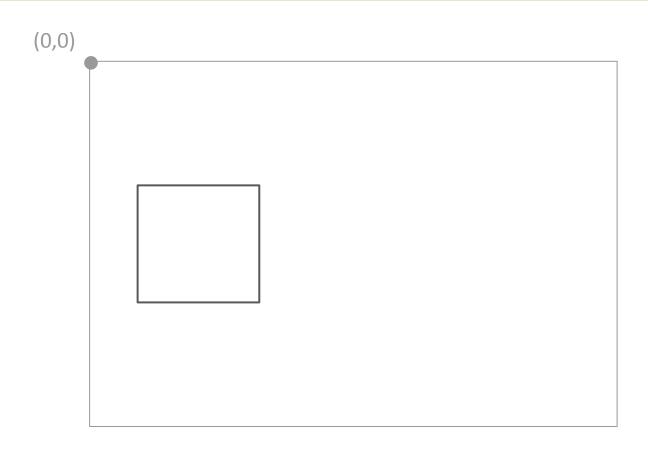

Ya sabemos cómo dibujar en un lienzo

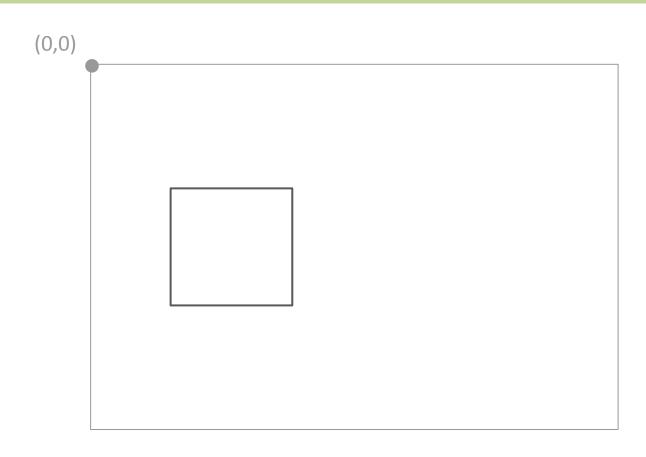

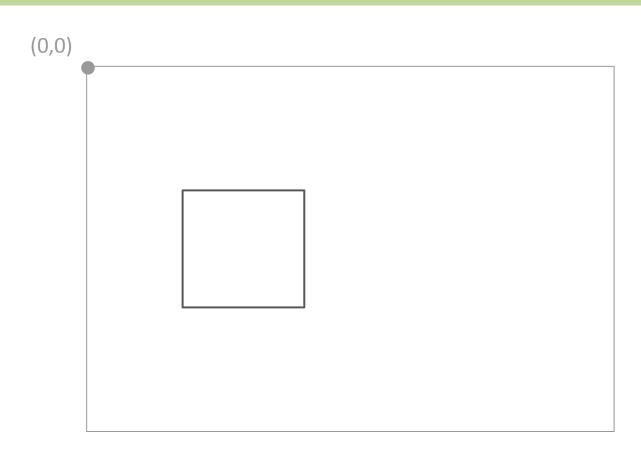

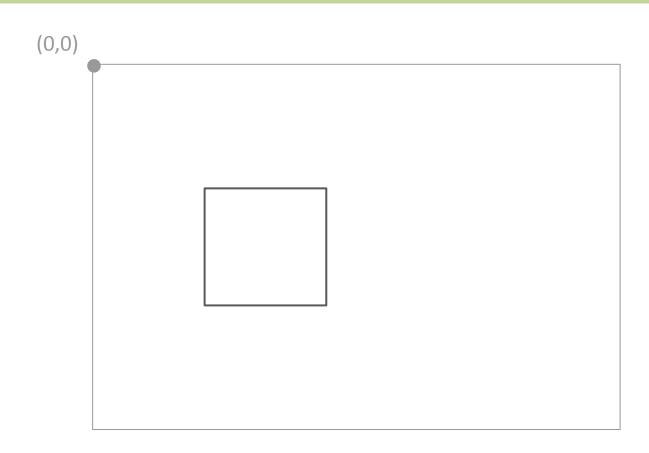

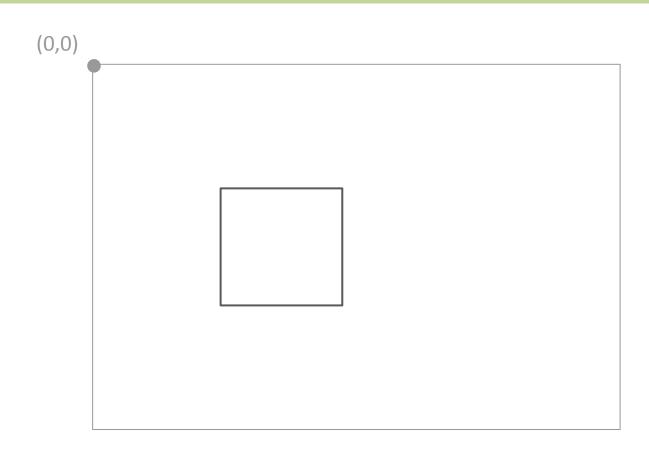

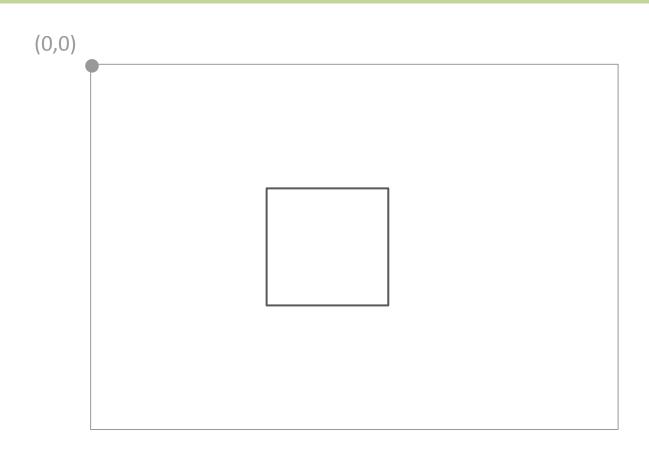

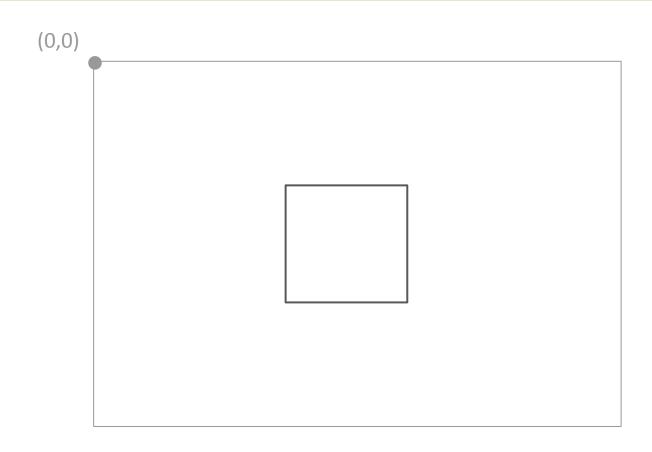

La animación es simplemente redibujar un lienzo rápidamente y muchas veces

Mover formas en Python canvas

```
2. def main():
       # prepara
       while True:
6. # actualice el mundo
8.
           # pausa
            time.sleep(0.01)
10.
11.
```

```
def main():
           prepara
         while True:
             # actualice el mundo
             # pausa
             time.sleep(0.01)
10.
11.
```

Haz todas las variables que necesites. Agregar los objetos gráficos al canvas

```
def main():
         # prepara
         while True:
             # actualice el mundo
             # pausa
             time.sleep(0.01)
10.
11.
```

El ciclo de animación es una repetición de latidos

```
def main():
         # prepara
         while True:
             # actualice el mundo
             # pausa
             time.sleep(0.01)
10.
11.
```

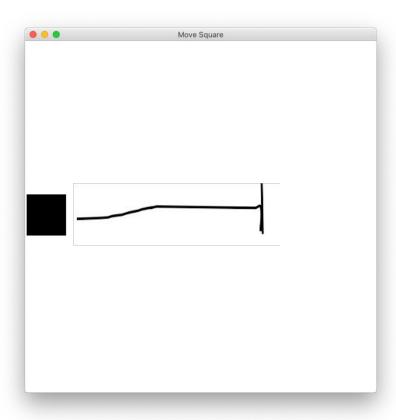

Cada latido, actualiza el mundo hacia adelante un paso.

El bucle de animacion

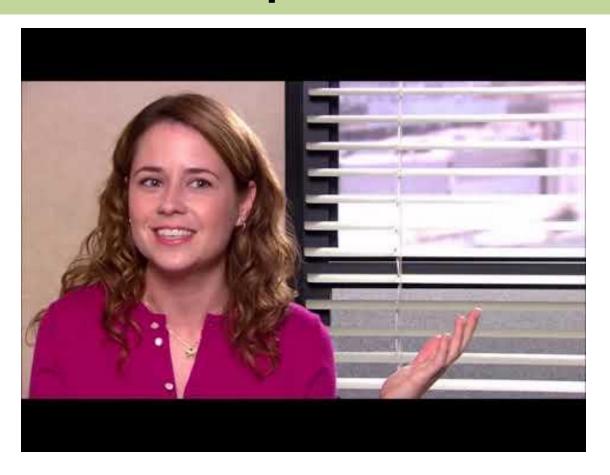

```
def main():
         # prepara
         while True:
             # actualice el mundo
             # pausa
             time.sleep(0.01)
10.
11.
```

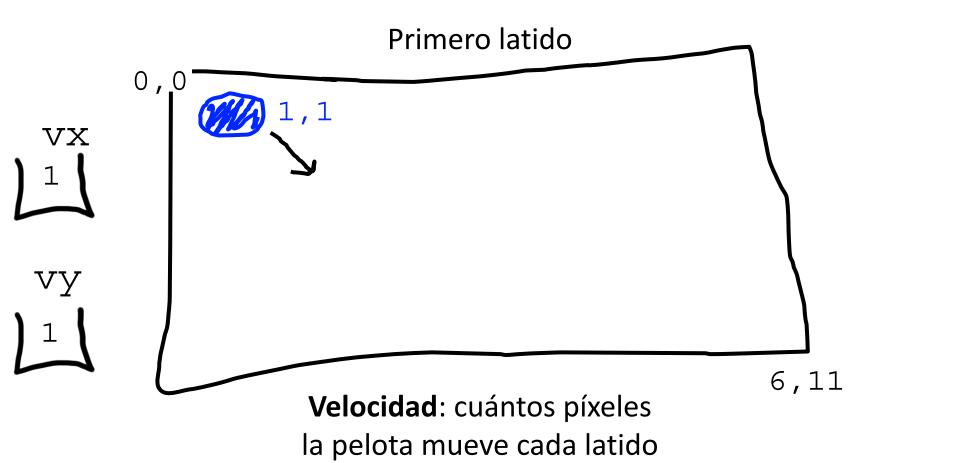

Si no haces una pausa, los humanos no podrán verlo.

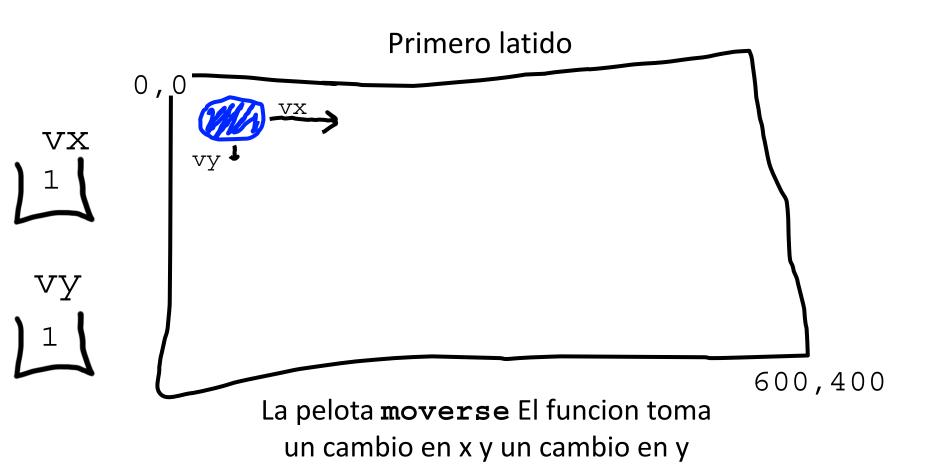

Ejemplo: Mover Rectangle

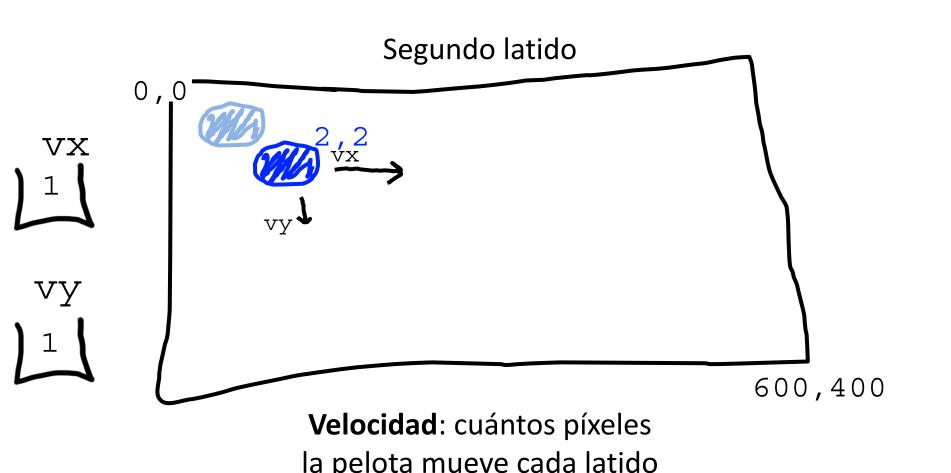

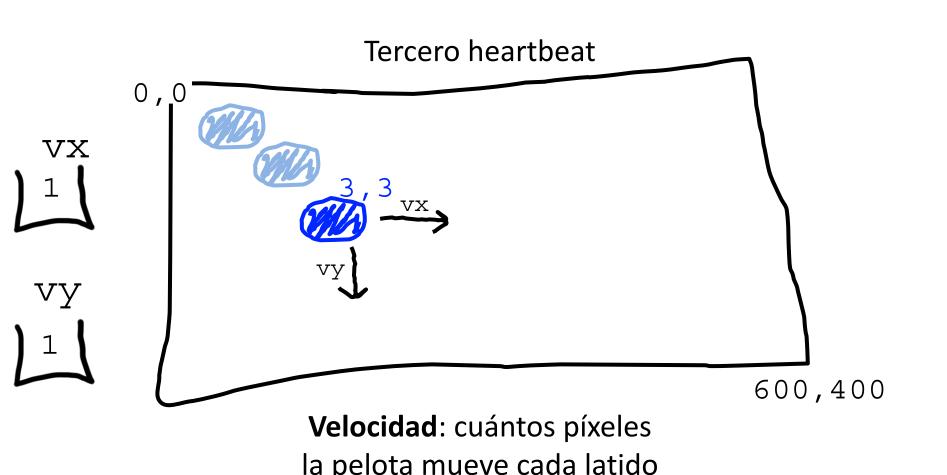

Cubo que rebota

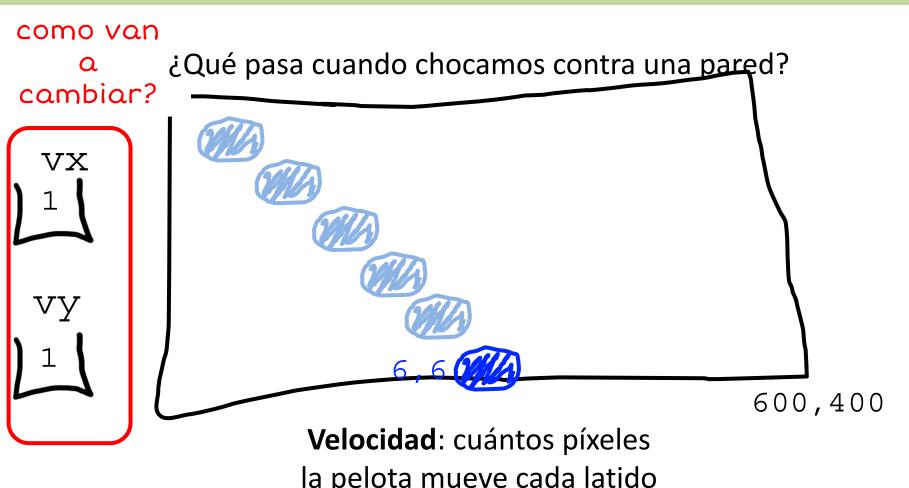

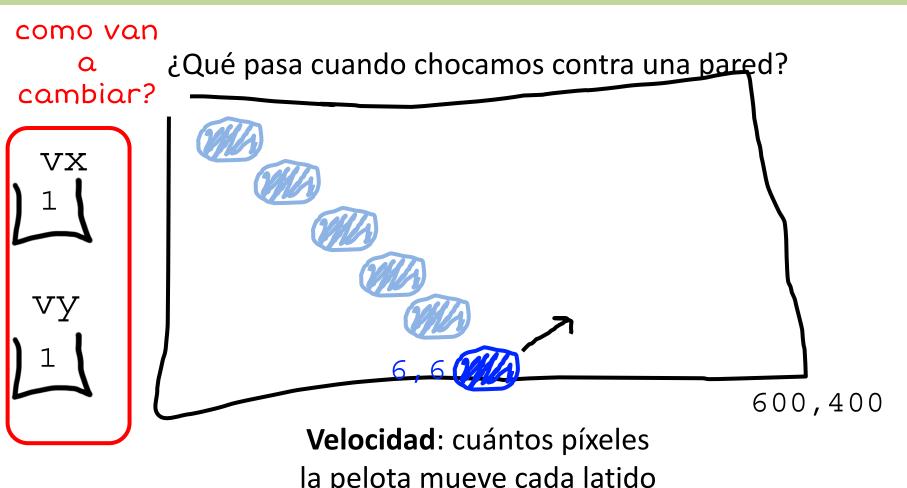

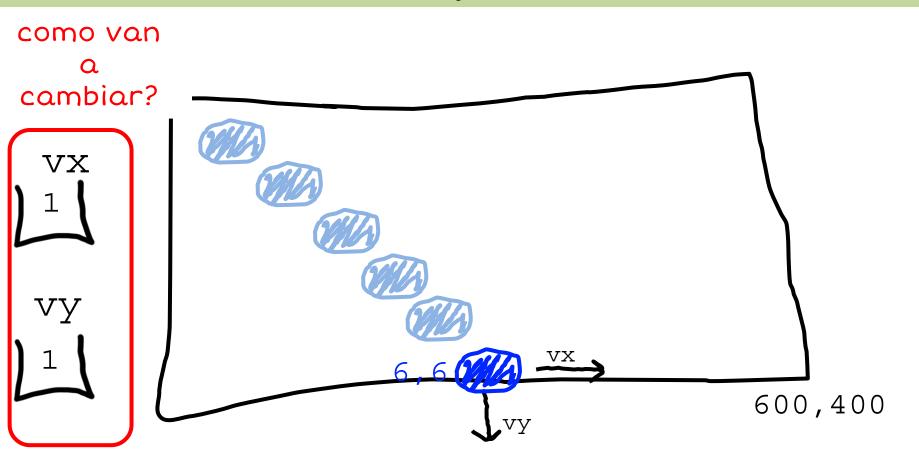

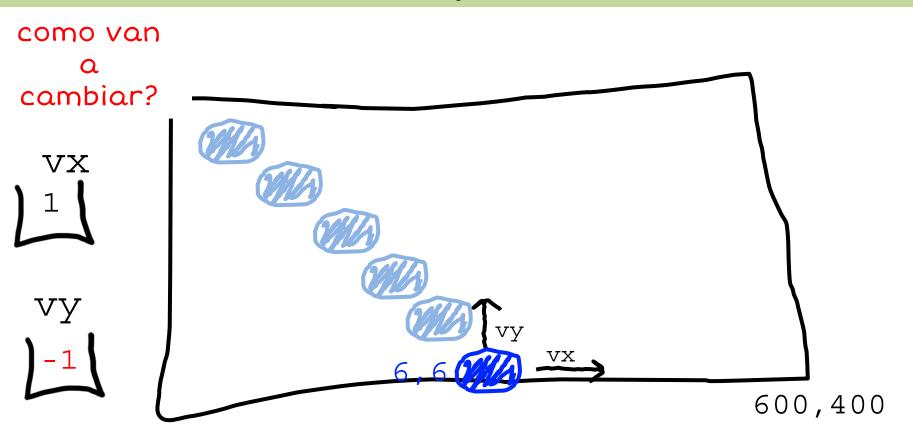

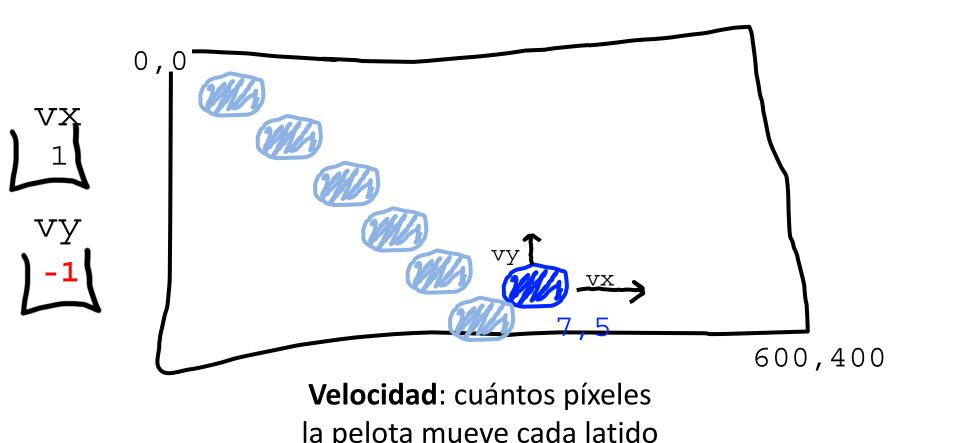

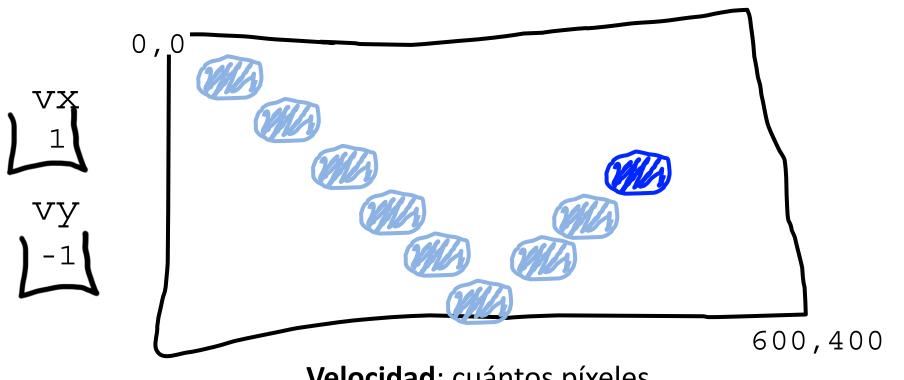

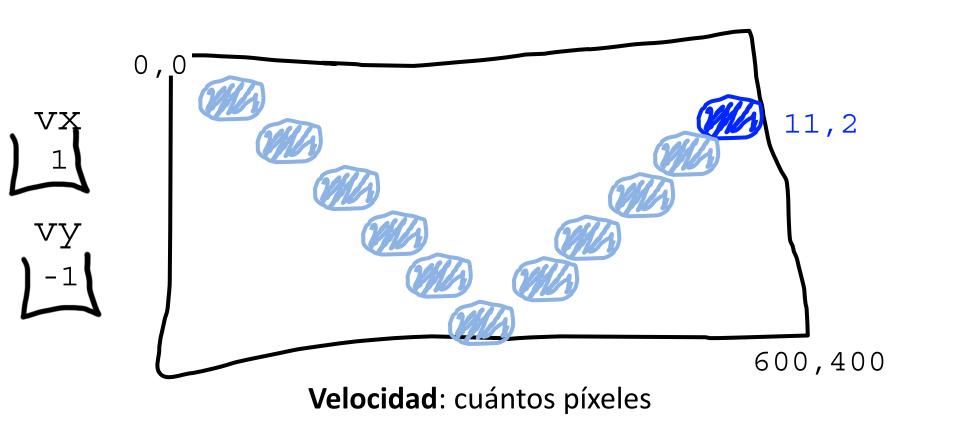

Velocidad: cuántos píxeles la pelota mueve cada latido

la pelota mueve cada latido
